

Import Data Using Transform Maps (Spreadsheet)

Project Description:

The **Import Data Using Transform Maps (Spreadsheet)** project is a ServiceNow-based data import solution that enables users to upload employee information from a spreadsheet and transform it into structured records in a target table.

The project uses the **Import Set** and **Transform Map** features of ServiceNow to transfer data from the uploaded spreadsheet to the target table. Field mapping is used to match spreadsheet columns with the corresponding target table fields. The project also uses **Coalesce** to identify existing records and prevent duplicate data during the transformation process. Data validation is performed before and during transformation to maintain data consistency and accuracy.

Scenarios:

Scenario 1:

An administrator uploads an employee spreadsheet containing Employee ID, Employee Name, Email, Department, and Location. The spreadsheet data is loaded into the Import Set Table and transformed into the Employee target table.

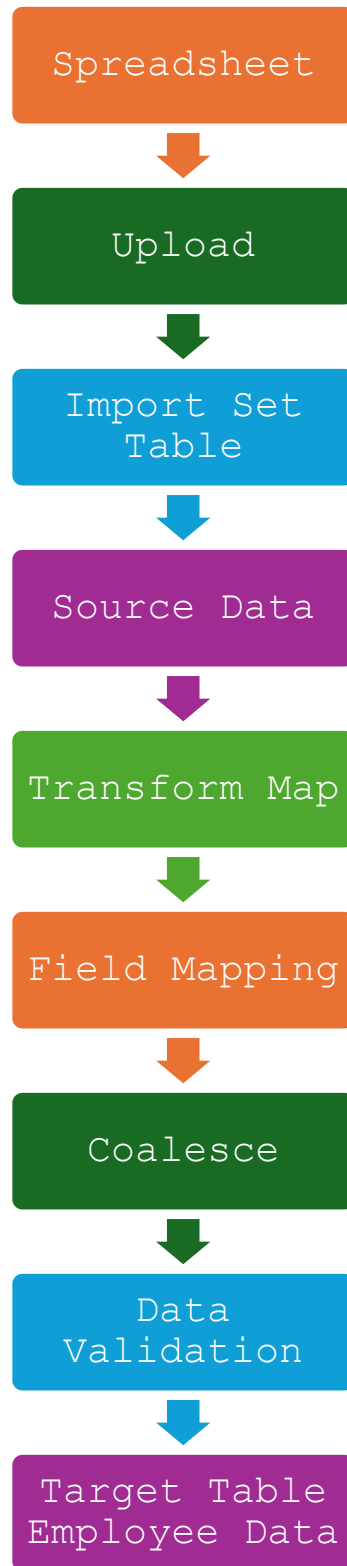

Scenario 2:

An employee record with an existing Employee ID is uploaded again. The Transform Map uses the Employee ID as a Coalesce field and updates the existing record instead of creating a duplicate record.

Scenario 3:

A spreadsheet contains missing or invalid data. The import and transformation process identifies the problematic records so that the data can be corrected before successful transformation.

Technical Architecture:

Description:

The architecture consists of a spreadsheet as the input source, an Import Set Table for temporarily storing imported data, and a Transform Map for transferring data to the target table.

Field Mapping defines the relationship between source and target fields. Coalesce is used to identify existing records based on a unique Employee ID. After validation and transformation, the final records are stored in the target Employee table.

Project Workflow

Milestone 1:

Spreadsheet and Table Preparation

Activity 1.1: Create the employee spreadsheet containing Employee ID, Employee Name, Email, Department, and Location.

Activity 1.2: Create the target Employee table in ServiceNow.

Activity 1.3: Create the required fields in the target table.

Activity 1.4: Verify the spreadsheet structure and target table fields.

Milestone 2:

Import Set Configuration

Activity 2.1: Navigate to **System Import Sets** → **Load Data**.

Activity 2.2: Upload the employee spreadsheet.

Activity 2.3: Create the Import Set Table.

Activity 2.4: Verify that the spreadsheet records are loaded into the Import Set Table.

Milestone 3:

Transform Map Configuration

Activity 3.1: Create a Transform Map.

Activity 3.2: Select the Import Set Table as the source table.

Activity 3.3: Select the Employee table as the target table.

Activity 3.4: Configure the required Field Maps.

Milestone 4:

Data Transformation and Validation

Activity 4.1: Map spreadsheet fields to target table fields.

Activity 4.2: Configure Employee ID as the Coalesce field.

Activity 4.3: Validate imported data.

Activity 4.4: Run the Transform Map.

Activity 4.5: Verify the transformed records in the target table.

Milestone 5:

Testing

Activity 5.1: Test successful spreadsheet import.

Activity 5.2: Test duplicate Employee ID handling.

Activity 5.3: Test missing or invalid data.

Activity 5.4: Verify the final target records.

Milestone 6:

Documentation and Conclusion

Activity 6.1: Capture screenshots of the implementation.

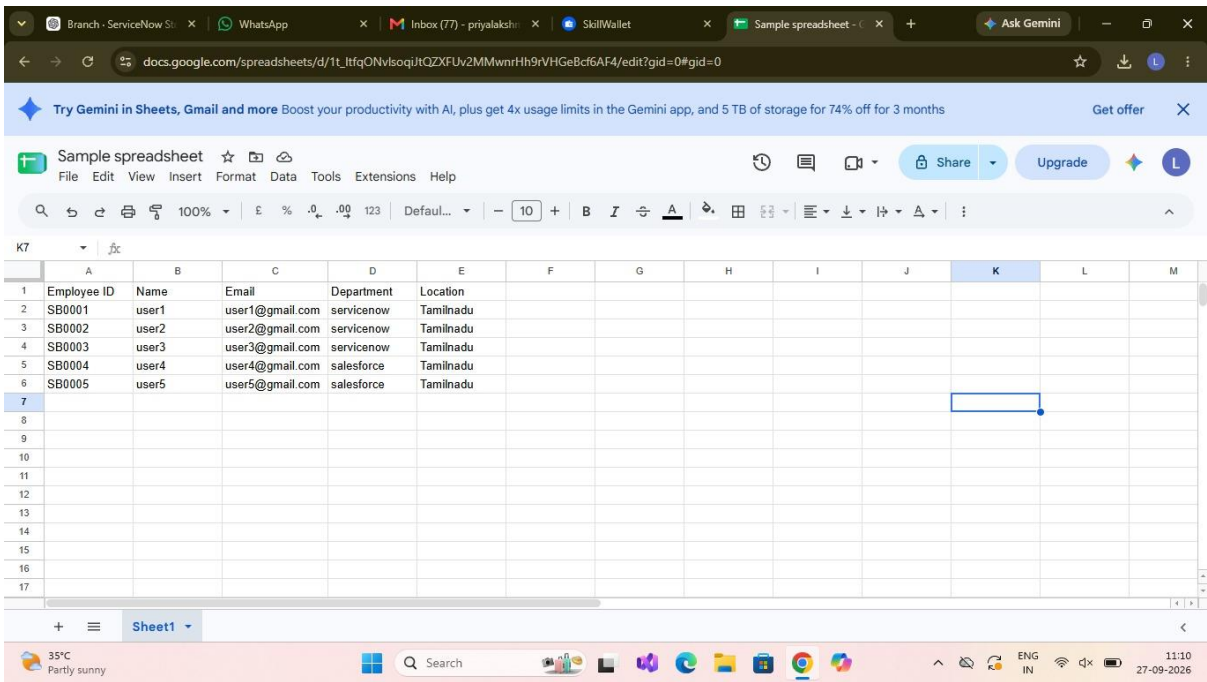

Activity 6.2: Document the configuration and results.

Activity 6.3: Prepare the final project documentation.

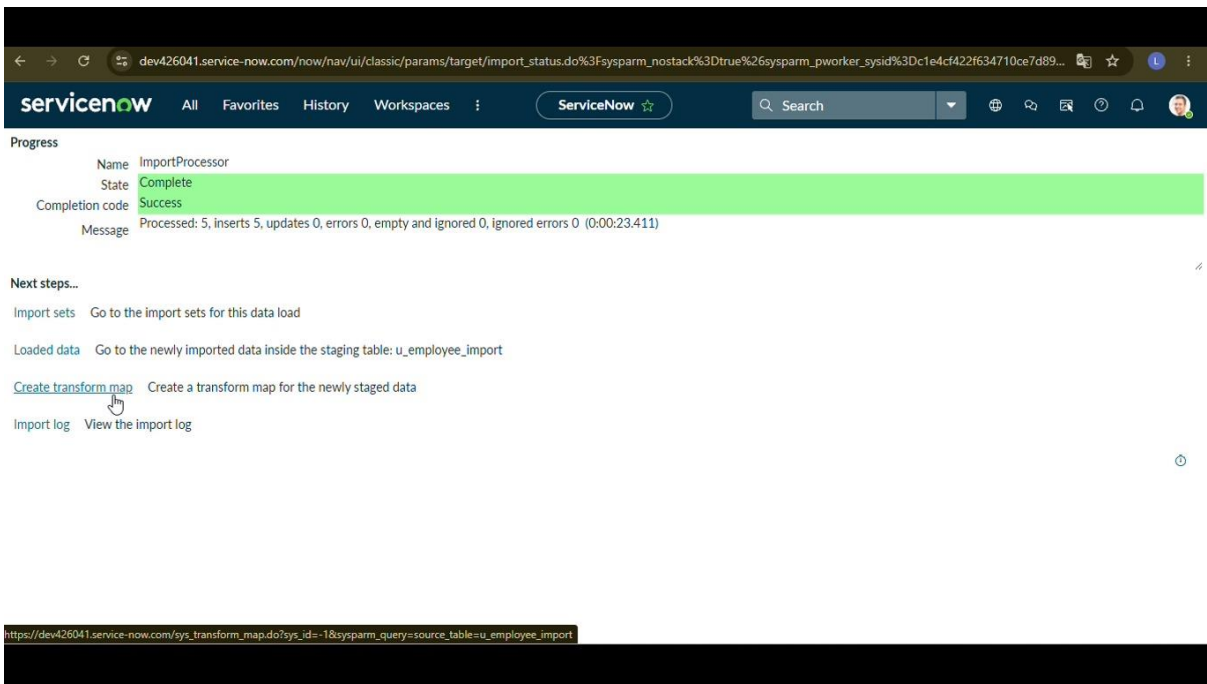

Activity 6.4: Submit the completed project files and documentation.

Load Data page

Import Set Table

The screenshot shows the 'Import Set Table' configuration page in ServiceNow. The 'Import set table' section has 'Create table' selected, with a 'Label' of 'Employee Import' and a 'Name' of 'u_employee_import'. The 'Source of the import' section has 'File' selected, with a 'File' field containing 'Sample spreadsheet.xlsx', a 'Sheet number' of '1', and a 'Header row' of '1'. A 'Submit' button is at the bottom.

Field Mapping

The screenshot shows the 'Table Transform Map - Sample Spreadsheet Import' field mapping interface. It displays a table with 5 rows of field mappings. The columns are 'Source field', 'Target field', and 'Coalesce'. The 'Source field' column is expanded, showing a list of fields: u_department, u_email, u_employee_id, u_location, and u_name. The 'Target field' column shows the corresponding target fields: u_department, u_email, u_employee_id, u_location, and u_employee_name. The 'Coalesce' column shows the coalesce status for each row, all of which are 'false'.

Coalesce configuration

The screenshot shows the 'Transform Histories' table in ServiceNow. The table has columns for Started, State, Completed, Run time, Set, Import set table, Total, Inserts, Updates, Ignored, Skipped, Errors, and Transform Map. A single row is displayed, indicating a successful import.

Started	State	Completed	Run time	Set	Import set table	Total	Inserts	Updates	Ignored	Skipped	Errors	Transform Map
2026-09-27 05:46:41	Complete	2026-09-27 05:46:42	1 Second	ISSET0010008	Employee Import [u_employee_import]	5	0	0	5	0	0	Sample Spreadsheet Import

Transform result

The screenshot shows the 'Specify Import set and Transform map' configuration page. It includes a dropdown for the 'Import set' (ISSET0010003 - u_employee_import (2026-09-27 10:39:42)), an 'Available maps' section, and a 'Selected maps, run in order' section. The 'Selected maps' section contains a single entry: 'Sample Spreadsheet Import - u_employee_test'. There are 'Add' and 'Remove' buttons between the sections, and a 'Transform' button at the bottom left.

Conclusion:

The **Import Data Using Transform Maps (Spreadsheet)** project demonstrates how spreadsheet data can be imported into ServiceNow using Import Sets and Transform Maps.

The project provides a structured process for loading spreadsheet data, mapping source fields to target fields, validating data, and transforming records into the target table.

The use of **Coalesce** helps identify existing records based on a unique field such as Employee ID and supports controlled data updates during transformation.

The project provides practical understanding of spreadsheet-based data import and transformation in the ServiceNow platform.
