

Solution Requirements

Project Details:

Date	30.09.2026
Team ID	SWTID-2026-3759
Project Name	Import Data Using Transform Maps (Spreadsheet)
Maximum Marks	4 Marks

Functional Requirements (FR):

S.No	Requirement Category	Requirement Description	Priority
1	Authentication	The system shall allow authorized users/admins to securely access the data import and transformation functions.	High
2	Authorization levels	The system shall provide appropriate access permissions for importing spreadsheet data, creating transform maps and viewing transformed employee records.	High
3	External interfaces	The system shall accept employee data from an Excel/CSV spreadsheet containing Employee ID, Employee Name, Email, Department and Location.	High
4	Transactions processing	The system shall import spreadsheet data into an Import Set Table and process the records through a Transform Map.	High
5	Reporting	The system shall allow users/admins to view imported, transformed and successfully processed employee records.	Medium
6	Business rules, etc.	The system shall validate employee data and use Employee ID as the Coalesce field to identify existing records and prevent duplicate employee records.	High
7	Compliance to laws or regulations	The system shall protect employee information and restrict access to authorized users. Sensitive employee information shall not be unnecessarily exposed.	Medium
8	Other	The system shall display import/transform status and identify records that contain invalid or missing information.	Medium

Non-Functional Requirements (NFR):

S.No	NFR Category	Requirement Description	Target Metric / Acceptance Criteria
1	Performance	Spreadsheet data should be imported and transformed within a reasonable time.	Import and transform should complete within an acceptable time for the uploaded dataset.
2	Security	Only authorized users should be able to access employee import and transformation functions.	Unauthorized users must not be allowed to perform import/transform operations.
3	Usability	The import process should be simple and easy to understand.	User should be able to upload the spreadsheet and run the transformation with minimal steps.
4	Reliability	The system should process valid records correctly without losing data.	All valid spreadsheet records should be successfully transformed and stored.
5	Data Accuracy	Employee information should be mapped to the correct target fields.	Employee ID, Name, Email, Department and Location must be correctly mapped.
6	Maintainability	Transform Maps and field mappings should be easy to modify when requirements change.	Administrator should be able to update mappings without changing the entire system.
7	Scalability	The system should support importing larger employee datasets.	System should continue processing when the number of spreadsheet records increases.
8	Error Handling	Invalid or incomplete records should be identified during transformation.	Import/transform results should clearly show failed or rejected records and their errors.
